## 1 Description

This document describes the communications between the SmartHub™ and Florlink Zigbee endpoint devices such as call buttons, light towers, etc.

## 2 Packet Framing

There are two types of packets involved at the application level, Transmit Packets and Receive Packets. Other packets such as Transmit Status and Modem Status are exchanged at the Zigbee level and will not be discussed in this document. Transmit Packets can be sent by either the SmartHub or an Endpoint. At the recipient's end, the packet will appear as a Receive Packet.

The following descriptions of these packets is a reproduction of information that can also be found in Digi International's documentation for the XBee3 devices at

[https://www.digi.com/resources/documentation/digidocs/90001539/#containers/cont\\_frame\\_descriptions.htm%3FTocPath%3DFrame%2520descriptions%7C\\_0](https://www.digi.com/resources/documentation/digidocs/90001539/#containers/cont_frame_descriptions.htm%3FTocPath%3DFrame%2520descriptions%7C_0)

### 2.1 Transmit Packet

| Start Delimiter | Length  | Frame Type     | Frame ID       | MAC Address | Dest Network Address | Broadcast radius | Transmit Options | Payload | CRC    |
|-----------------|---------|----------------|----------------|-------------|----------------------|------------------|------------------|---------|--------|
| 1 Byte<br>0x7E  | 2 Bytes | 1 Byte<br>0x10 | 1 Byte<br>0x01 | 8 Bytes     | 2 Bytes              | 1 Byte<br>0x00   | 1 Byte<br>0x00   | Var     | 1 Byte |

### 2.2 Receive Packet

| Start Delimiter | Length  | Frame Type     | MAC Address | Network Address | Receive options | Payload | CRC    |
|-----------------|---------|----------------|-------------|-----------------|-----------------|---------|--------|
| 1 Byte<br>0x7E  | 2 Bytes | 1 Byte<br>0x90 | 8 Bytes     | 2 Bytes         | 1 Byte          | Var     | 1 Byte |

## 2.3 Framing Values

| Field                         | Size (Bytes) | Value(s)  | Description  |
|-------------------------------|--------------|---|--|
| <b>Start Delimiter</b>        | 1            | 0x7E  | The start-of-packet delimiter  |
| <b>Length</b>                 | 2            | Length of the packet in bytes, excluding the start delimiter, Length, and CRC fields.   |  |
| <b>Frame Type</b>             | 1            | 0x10 for Transmit<br>0x90 for Receive   | The frame type of the message  |
| <b>Frame ID</b>               | 1            | 0x01  | For correlating packets that arrive out of sequence. We don't use it and always set it to 0x01. Setting it to 0 means that no Zigbee-level ACK will be generated by the recipient. |
| <b>MAC Address</b>            | 8            | Set to the MAC address of the target when transmitting. When sending to the coordinator, set to all zeroes. When receiving, it's automatically populated by the Zigbee layer with the MAC address of the sender.  |  |
| <b>16-Bit Network Address</b> | 2            | When transmitting to a single endpoint using 64-bit MAC addressing, or when addressing the coordinator with MAC address 0x0, this should be set to 0xFFE. When receiving it will be populated with the 16-bit network address of the sender.<br>To broadcast to all non-sleeping endpoints, set to 0xFFFFD.<br>To broadcast to all, including sleeping, endpoints, set to 0xFFFF. |  |
| <b>Broadcast Radius</b>       | 1            | 0x00  | 0x00 is maximum hops. Present in all transmit packets, but affects only broadcast transmissions.   |
| <b>Transmit Options</b>       | 1            | 0x00  | Applies to Transmit Packets only. No options used.   |
| <b>Receive Options</b>        | 1            | Applies to Receive Packets only. Bit 0 indicates whether the packet was acknowledged at the Zigbee layer. See Digi docs for other bits.   |  |
| <b>Payload</b>                | Variable     | The payload data. See Section 3, Payload Framing.   |  |
| <b>CRC</b>                    | 1            |   | The CRC (checksum) of the packet   |

## 2.4 CRC (Checksum) Calculation

The checksum calculation is as follows:

Add all the bytes of the packet excluding the frame delimiter and the length.

Keep the lowest eight bits.

Subtract the result from 0xFF

The result is the CRC.

Example:

7E 00 0A **01 01 50 01 00 48 65 6C 6C 6F B8**

01 + 01 + 50 + 01 + 00 + 48 + 65 + 6C + 6C + 6F = **247**

0xFF - 0x47 = 0xB8

## 3 Payload Framing

| Message ID | Try    | SW Version | Data     |
|------------|--------|------------|----------|
| 1 Byte     | 1 Byte | 2 Bytes    | Variable |

### 3.1 Payload Framing Values

| Field      | Size (Bytes) | Description   |
|------------|--------------|---|
| Message ID | 1            | The Message ID of the payload   |
| Try        | 1            | The number of retries sending the message. The first message sent is Try 0. |
| SW Version | 2            | The endpoint's microcontroller firmware version, in BCD.                    |
| Data       | Var          | Payload data  |

### 3.2 Message ID's

| Message ID | Name                    | Description   |
|------------|-------------------------|---|
| 0x40       | Button Press            | Sent by button to hub when a button is pressed.   |
| 0x41       | Button press ACK        | Sent by hub to button to ACK button press.  |
| 0x42       | Button Cancel           | Sent by button to hub when request is cancelled. Contains cancellation type (manual or timeout).  |
| 0x43       | Button Cancel ACK       | Sent by hub to button to ACK request cancellation.  |
| 0x44       | Heartbeat               | Sent by button to hub after receipt of each 0x41 Button Press ACK, and periodically if dry contacts enabled or periodic heartbeat is enabled. Contains battery voltage and dry contacts status. Heartbeats are not ACKed. |
| 0x46       | “Cancel Button” ACK     | Sent by hub to button; causes button to immediately cancel request and return to idle state.  |
| 0x47       | Light Tower Control     | Sent by hub to light tower to set light and sound parameters.   |
| 0x48       | Light Tower Message ACK | Sent by light tower to ACK light tower control message.   |

### 3.3 Payload Data Examples

The following payload data examples include the payload framing in the shaded cells.

#### 3.3.1 Button Press

| Message ID 0x40 | Try Num | Firmware Vn | Pressed Button |
|-----------------|---------|-------------|----------------|
| 1 Byte          | 1 Byte  | 2Bytes      | 1 Byte         |

| Field          | Size (Bytes) | Values   | Description                 |
|----------------|--------------|--|-----------------------------|
| Pressed Button | 1            | 0x01 - Button 1<br>0x02 - Button 2<br>0x03 - Button 3<br>0x04 - Button 4 | The button that was pressed |

#### 3.3.2 Button Press ACK

This message is received by the end point from the main hub in acknowledgment of a button press message.

| Message ID 0x41 | Try Num | Firmware Vn | Pressed Button |
|-----------------|---------|-------------|----------------|
| 1 Byte          | 1 Byte  | 2Bytes      | 1 Byte         |

| Field          | Size (Bytes) | Values   | Description            |
|----------------|--------------|--|------------------------|
| Pressed Button | 1            | 0x01 - Button 1<br>0x02 - Button 2<br>0x03 - Button 3<br>0x04 - Button 4 | The button being ACKed |

### 3.3.3 Button Cancel

This message is sent to the SmartHub when a button call is handled. Either an associate turned off the button request, or the end point timed out waiting for an associate to turn off the button request.

| Message ID 0x42 | Try Num | Firmware Vn | Button Terminated | Reason |
|-----------------|---------|-------------|-------------------|--------|
| 1 Byte          | 1 Byte  | 2Bytes      | 1 Byte            | 1 Byte |

| Field             | Size (Bytes) | Values   | Description                   |
|-------------------|--------------|--|-------------------------------|
| Button Terminated | 1            | 0x01 - Button 1<br>0x02 - Button 2<br>0x03 - Button 3<br>0x04 - Button 4 | The button that was cancelled |
| Reason            | 1            | 0x01 - Associate<br>0x02 - Timeout                                       | The reason for cancellation.  |

### 3.3.4 Button Cancel ACK

This message is sent by the main hub to the end point to let the endpoint know it has received a Button Cancel message.

| Message ID 0x43 | Try Num | Firmware Vn | Button Terminated |
|-----------------|---------|-------------|-------------------|
| 1 Byte          | 1 Byte  | 2Bytes      | 1 Byte            |

| Field             | Size (Bytes) | Values   | Description            |
|-------------------|--------------|--|------------------------|
| Button Terminated | 1            | 0x01 - Button 1<br>0x02 - Button 2<br>0x03 - Button 3<br>0x04 - Button 4 | The button being ACKed |

### 3.3.5 Heartbeat

The heartbeat message serves several purposes, and can be configured for various operational modes in the endpoint firmware. The heartbeat contains the endpoint's battery voltage, and in the case of a "dry-contact" endpoint, the status of the contact inputs. A periodic heartbeat message can be used to maintain an endpoint's position in the coordinator's "child table", if sent more frequently than the child table timeout, thus eliminating the re-joining time required when the endpoint is not in the child table.

Heartbeat messages do not expect an ACK from the SmartHub.

Single-button call buttons send a heartbeat message immediately after receiving a "Button Request Release ACK" message (Message ID 0x41) from the SmartHub.

Four-button call buttons with dry contact inputs enabled send heartbeat messages periodically (typically every 60 seconds) in order to ensure that the SmartHub always has accurate contact inputs status information.

Both the single-button and four-button can be configured to send periodic heartbeats regardless of dry contacts being enabled or not.

| Message ID 0x44 | Try Num<br>(always<br>0x00) | Firmware Vn | Contacts Status  | Battery Voltage       |
|-----------------|-----------------------------|-------------|--|-----------------------|
| 1 Byte          | 1 Byte                      | 2 Bytes     | 1 Byte (lower four bits show the status of the four contact inputs: 0=open, 1=closed.) | 2 Bytes in BCD format |

It is up to the SmartHub to decide when an endpoint's battery voltage is low enough that a low-battery notification should be published. V2 call buttons can operate down to 1.9V, whereas v3 buttons should have their batteries replaced on reaching 2.3V.

### 3.3.6 “Cancel Button” Functionality

In some instances, such as those where an associate may be summoned to an area based on camera data rather than by a call button, a call button is deployed not for guest use, but instead for associates to register that they've responded to such a summons. To support this use case, a call button can be defined in the SmartHub portal as a “Cancel Button”. When such a button is pressed, its button press message will be ACKed by the hub with a Cancel Button ACK message rather than by a Button Press ACK, on receipt of which the button will immediately return to its idle state.

This functionality would typically only be used with a single-button call button, but it's incorporated in the four-button firmware as well.

| Message ID 0x46 | Try Num | Firmware Vn | Button Pressed |
|-----------------|---------|-------------|----------------|
| 1 Byte          | 1 Byte  | 2 Bytes     | 1 Byte         |

| Field          | Size (Bytes) | Values   | Description            |
|----------------|--------------|--|------------------------|
| Button Pressed | 1            | 0x01 - Button 1<br>0x02 - Button 2<br>0x03 - Button 3<br>0x04 - Button 4 | The button being ACKed |

### 3.3.7 Light Tower Control Message (Preliminary)

The light tower consists of a sound module variable and a number of light modules. In the unit shown here, which is our tentative choice for production, the sound module is in the base module, so we're going to assign "Level 1" to always be the sound module. The number of light levels is TBD and may vary from installation to installation, as may the order of the colors.

Unless the addressed level is set to 0, a Light Tower Control Message affects only one level at a time; it is necessary to send multiple messages to change the status of multiple levels, and only the status of the level being addressed is changed by the message. If Level is set to 0, all levels (including the sound module) are assigned the passed parameters. This is convenient for turning everything off with one message.

| Message ID 0x47 | Try Num | Firmware Vn | Tower Level | Period  | Duration |
|-----------------|---------|-------------|-------------|---------|----------|
| 1 Byte          | 1 Byte  | 2 Bytes     | 1 Byte      | 2 Bytes | 2 Bytes  |

| Field       | Size (Bytes) | Description   |
|-------------|--------------|---|
| Tower Level | 1            | The tower level being addressed, numbered bottom-to-top starting from the lowest level = 1, which is the sound module. If this field is 0, the passed parameters are applied to <u>all</u> levels.                                |
| Period      | 2            | If flashing or beeping is desired, set this to a non-zero number of milliseconds to determine the repetition rate. If set to 0, the addressed module will maintain a steady state.  |
| Duration    | 2            | If set to 0, the addressed module will be Off. If non-zero and Period = 0, the addressed module will be steadily On. If non-zero and Period is non-zero, Duration determines the duration of each flash or beep, in milliseconds. |

### 3.3.8 Light Tower Message ACK

Sent by the Light Tower to the Hub to ACK a Light Tower Control Message

| Message ID 0x48 | Try Num | Firmware Vn | Tower Level Addressed |
|-----------------|---------|-------------|-----------------------|
| 1 Byte          | 1 Byte  | 2Bytes      | 1 Byte                |

| Field                 | Size (Bytes) | Values                 | Description  |
|-----------------------|--------------|------------------------|--|
| Tower Level Addressed | 1            | 0x00 – tower max level | The tower level addressed by the message being ACKed |

## Revision History

| Date         | Engineer        | Comment  |
|--------------|-----------------|--|
| Sept-12-2016 | Ken Dussinger   | Initial Release  |
| Sept-14-2016 | Ken Dussinger   | Added SW version to the message header. Added JSON message structure to the individual messages                                    |
| Oct-11-2016  | Matt Klepadlo   | Reworked Message Spec to follow a binary serial protocol   |
| 22 May 2020  | Julia Truchsess | Reformatted the entire document<br>Updated to new Heartbeat message format<br>Added Cancel Button ACK<br>Added Light Tower Control |
